LiveCode 9.0.0-dp-4 Release Notes

Overview

Known issues

Platform support

- Windows
- Linux
- Mac
- iOS
- Android
- HTML5

Setup

- Installation
- Uninstallation
- Reporting installer issues
- Activating LiveCode Indy or Business edition
- Command-line installation
- Command-line uninstallation
- Command-line activation for LiveCode Indy or Business edition

Engine changes

- Maximum text length on iOS native input fields (9.0.0-dp-4)
- Throw error when changing behavior from behavior script (9.0.0-dp-4)
- Support for loading multi-module bytecode files (9.0.0-dp-4 - experimental)
- Ensure CMYK JPEGs display correctly on Mac (9.0.0-dp-4)
- Calling JavaScript from HTML5 (9.0.0-dp-2)
- Re-written LCB VM (9.0.0-dp-2)
- Undocumented multi-file libUrlMultipartFormAddPart removed (9.0.0-dp-2)
- libURLSetStatusCallback no longer requires a target object for the message (9.0.0-dp-1)
- Platform support end-of-life (9.0.0-dp-1)
- Field tab alignments in htmlText and styledText (9.0.0-dp-1)
- Specific engine bug fixes (9.0.0-dp-4)
- Specific engine bug fixes (9.0.0-dp-3)
- Specific engine bug fixes (9.0.0-dp-2)
- Specific engine bug fixes (9.0.0-dp-1)

IDE changes

- Show up to 10 nested behavior in the Project Browser (9.0.0-dp-4)
- Reinstate store tab of extension manager (9.0.0-dp-4)
- SVG icon support in the Extension Builder (9.0.0-dp-4)
- <Shift+Tab> reformats entire script (9.0.0-dp-4)
- Create script only stack behavior (9.0.0-dp-3)
- Allow substack to become a mainstack via property inspector (9.0.0-dp-2)
- Drag and drop stackfiles (9.0.0-dp-2)
- Specific IDE bug fixes (9.0.0-dp-4)
- Specific IDE bug fixes (9.0.0-dp-3)
Overview

LiveCode 9.0 enables access to libraries and platform APIs written in many other languages thanks to the community-funded 'Infinite LiveCode' project.

This includes a greatly improved LiveCode Builder virtual machine.

LiveCode 9.0 contains many additional improvements to support LiveCode app developers, including:

- A new "spinner" widget
- OAuth2 authentication library for use with web APIs (e.g. Facebook, Google and GitHub)
- A command argument parser library for building command-line standalones
- Updates and performance improvements for existing widgets

Known Issues

- The installer will currently fail if you run it from a network share on Windows. Please copy the installer to a local disk before launching on this platform.
- The browser widget does not work on 32-bit Linux.
64-bit standalones for Mac OS X do not have support for audio recording or the revVideoGrabber external.

**Platform support**

The engine supports a variety of operating systems and versions. This section describes the platforms that we ensure the engine runs on without issue (although in some cases with reduced functionality).

**Windows**

LiveCode supports the following versions of Windows:

- Windows 7 (both 32-bit and 64-bit)
- Windows Server 2008
- Windows 8.x (Desktop)
- Windows 10

**Note:** On 64-bit Windows installations, LiveCode runs as a 32-bit application through the WoW layer.

**Linux**

LiveCode supports the following Linux distributions, on 32-bit or 64-bit Intel/AMD or compatible processors:

- Ubuntu 14.04 and 16.04
- Fedora 23 & 24
- Debian 7 (Wheezy) and 8 (Jessie) [server]
- CentOS 7 [server]

LiveCode may also run on Linux installations which meet the following requirements:

- Required dependencies for core functionality:
  - glibc 2.13 or later
  - glib 2.0 or later

- Optional requirements for GUI functionality:
  - GTK/GDK 2.24 or later
  - Pango with Xft support
  - esd (optional, needed for audio output)
  - mplayer (optional, needed for media player functionality)
  - icms (optional, required for color profile support in images)
  - gksu (optional, required for privilege elevation support)

**Note:** If the optional requirements are not present then LiveCode will still run but the specified features will be disabled.

**Note:** The requirements for GUI functionality are also required by Firefox and Chrome, so if your
Linux distribution runs one of those, it will run LiveCode.

**Note:** It may be possible to compile and run LiveCode Community for Linux on other architectures but this is not officially supported.

### Mac

The Mac engine supports:

- 10.9.x (Mavericks) on Intel
- 10.10.x (Yosemite) on Intel
- 10.11.x (El Capitan) on Intel
- 10.12.x (Sierra) on Intel

### iOS

iOS deployment is possible when running LiveCode IDE on a Mac, and provided Xcode is installed and has been set in LiveCode Preferences (in the Mobile Support pane).

Currently, the supported versions of Xcode are:

- Xcode 6.2 on MacOS X 10.9
- Xcode 6.2 and 7.2 on Mac OS X 10.10
- Xcode 8.1 on MacOS X 10.11
- Xcode 8.1 on MacOS 10.12

It is also possible to set other versions of Xcode, to allow testing on a wider range of iOS simulators. For instance, on MacOS 10.12 (Sierra), you can add Xcode 6.2 in the Mobile Support preferences, to let you test your stack on the iOS Simulator 8.2.

We currently support deployment for the following versions of iOS:

- 8.2 [simulator]
- 9.2
- 10.1

### Android

LiveCode allows you to save your stack as an Android application, and also to deploy it on an Android device or simulator from the IDE.

Android deployment is possible from Windows, Linux and Mac OSX.

The Android engine supports devices using ARMv7 or ARMv8 processors. It will run on the following versions of Android:

- 4.1-4.3 (Jelly Bean)
- 4.4 (KitKat)
- 5.0-5.1 (Lollipop)
- 6.0 (Marshmallow)

To enable deployment to Android devices, you need to download the Android SDK, and then use
the 'Android SDK Manager' to install:
- the latest "Android SDK Tools"
- the latest "Android SDK Platform Tools"

You also need to install the Java Development Kit (JDK). On Linux, this usually packaged as "openjdk". LiveCode requires JDK version 1.6 or later.

Once you have set the path of your Android SDK in the "Mobile Support" section of the LiveCode IDE's preferences, you can deploy your stack to Android devices.

Some users have reported successful Android Watch deployment, but it is not officially supported.

**HTML5**

LiveCode applications can be deployed to run in a web browser, by running the LiveCode engine in JavaScript and using modern HTML5 JavaScript APIs.

HTML5 deployment does not require any additional development tools to be installed.

LiveCode HTML5 standalone applications are currently supported for running in recent versions of Mozilla Firefox, Google Chrome or Safari. For more information, please see the "HTML5 Deployment" guide in the LiveCode IDE.

**Setup**

**Installation**

Each version of LiveCode installs can be installed to its own, separate folder. This allow multiple versions of LiveCode to be installed side-by-side. On Windows (and Linux), each version of LiveCode has its own Start Menu (or application menu) entry. On Mac OS X, each version has its own app bundle.

On Mac OS X, install LiveCode by mounting the .dmg file and dragging the app bundle to the Applications folder (or any other suitable location).

For Windows and Linux, the default installation locations when installing for "All Users" are:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows</td>
<td>&lt;x86 program files folder&gt;/RunRev/LiveCode &lt;version&gt;</td>
</tr>
<tr>
<td>Linux</td>
<td>/opt/livecode/livecode-&lt;version&gt;</td>
</tr>
</tbody>
</table>

The installations when installing for "This User" are:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows</td>
<td>&lt;user roaming app data folder&gt;/RunRev/Components/LiveCode &lt;version&gt;</td>
</tr>
<tr>
<td>Linux</td>
<td>~/.runrev/components/livecode-&lt;version&gt;</td>
</tr>
</tbody>
</table>

**Note:** If installing for "All Users" on Linux, either the `gksu` tool must be available, or you must
manually run the LiveCode installer executable as root (e.g. using `sudo` or `su`).

Uninstallation

On Windows, the installer hooks into the standard Windows uninstall mechanism. This is accessible from the "Add or Remove Programs" applet in the Windows Control Panel.

On Mac OS X, drag the app bundle to the Trash.

On Linux, LiveCode can be removed using the `setup.x86` or `setup.x86_64` program located in LiveCode's installation directory.

Reporting installer issues

If you find that the installer fails to work for you then please report it using the LiveCode Quality Control Centre or by emailing support@livecode.com.

Please include the following information in your report:

- Your platform and operating system version
- The location of your home or user folder
- The type of user account you are using (guest, restricted, admin etc.)
- The installer log file.

The installer log file can be located as follows:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows 2000/XP</td>
<td><code>&lt;documents and settings folder&gt;/&lt;user&gt;/Local Settings/</code></td>
</tr>
<tr>
<td>Windows Vista/7</td>
<td><code>&lt;users folder&gt;/&lt;user&gt;/AppData/Local/RunRev/Logs</code></td>
</tr>
<tr>
<td>Linux</td>
<td><code>&lt;home&gt;/.runrev/logs</code></td>
</tr>
</tbody>
</table>

Activating LiveCode Indy or Business edition

The licensing system ties your product licenses to a customer account system, meaning that you no longer have to worry about finding a license key after installing a new copy of LiveCode. Instead, you simply have to enter your email address and password that has been registered with our customer account system and your license key will be retrieved automatically.

Alternatively it is possible to activate the product via the use of a specially encrypted license file. These will be available for download from the customer center after logging into your account. This method will allow the product to be installed on machines that do not have access to the internet.

Command-line installation

It is possible to invoke the installer from the command-line on Linux and Windows. When doing command-line installation, no GUI will be displayed. The installation process is controlled by arguments passed to the installer.
Run the installer using a command in the form:

```
<installer> install noui [OPTION ...]
```

where `<installer>` should be replaced with the path of the installer executable or app (inside the DMG) that has been downloaded. The result of the installation operation will be written to the console.

The installer understands any of the following `OPTION`s:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-allusers</td>
<td>Install the IDE for &quot;All Users&quot;. If not specified, LiveCode will be installed for the current user only.</td>
</tr>
<tr>
<td>-desktopshortcut</td>
<td>Place a shortcut on the Desktop (Windows-only)</td>
</tr>
<tr>
<td>-startmenu</td>
<td>Place shortcuts in the Start Menu (Windows-only)</td>
</tr>
<tr>
<td>-location LOCATION</td>
<td>The folder to install into. If not specified, the LOCATION defaults to those described in the &quot;Installation&quot; section above.</td>
</tr>
<tr>
<td>-log LOGFILE</td>
<td>The file to which to log installation actions. If not specified, no log is generated.</td>
</tr>
</tbody>
</table>

**Note:** the command-line installer does not do any authentication. When installing for "All Users", you will need to run the installer command as an administrator.

As the installer is actually a GUI application, it needs to be run slightly differently from other command-line programs.

On Windows, the command is:

```
start /wait <installer> install noui [OPTION ...]
```

### Command-line uninstallation

It is possible to uninstall LiveCode from the command-line on Windows and Linux. When doing command-line uninstallation, no GUI will be displayed.

Run the uninstaller using a command of the form:

```
<uninstaller> uninstall noui
```

Where is `.setup.exe` on Windows, and `.setup.x86` on Linux. This executable, for both of the platforms, is located in the folder where LiveCode is installed.

The result of the uninstallation operation will be written to the console.

**Note:** the command-line uninstaller does not do any authentication. When removing a version of
LiveCode installed for "All Users", you will need to run the uninstaller command as an administrator.

**Command-line activation for LiveCode Indy or Business edition**

It is possible to activate an installation of LiveCode for all users by using the command-line. When performing command-line activation, no GUI is displayed. Activation is controlled by passing command-line arguments to LiveCode.

Activate LiveCode using a command of the form:

```
<livecode> activate -file LICENSEFILE -passphrase SECRET
```

where `<livecode>` should be replaced with the path to the LiveCode executable or app that has been previously installed.

This loads license information from the manual activation file `LICENSEFILE`, decrypts it using the given `SECRET` passphrase, and installs a license file for all users of the computer. Manual activation files can be downloaded from the [My Products] page in the LiveCode account management site.

It is also possible to deactivate LiveCode with:

```
<livecode> deactivate
```

Since LiveCode is actually a GUI application, it needs to be run slightly differently from other command-line programs.

On Windows, the command is:

```
start /wait <livecode> activate -file LICENSE -passphrase SECRET
start /wait <livecode> deactivate
```

On Mac OS X, you need to do:

```
<livecode>/Contents/MacOS/LiveCode activate -file LICENSE -passphrase SECRET
<livecode>/Contents/MacOS/LiveCode deactivate
```

**Engine changes**

**Maximum text length on iOS native input fields (9.0.0-dp-4)**

It is now possible to set/get the maximum number of characters that can be entered into an iOS native single-line field, using
Throw error when changing behavior from behavior script (9.0.0-dp-4)

Previously it was theoretically possible to change the behavior of an object from that object’s existing behavior script. This will now result in an execution error

```
parentScript: can't change parent while parent script is executing
```

This change was necessarily as the engine would occasionally crash when changing a behavior this way, and would be guaranteed to crash if stepping over the behavior script line that changes the behavior.

Support for loading multi-module bytecode files (9.0.0-dp-4 - experimental)

The `load extension` command is now able to load LiveCode Builder bytecode files (.lcm files) that contain multiple modules' bytecode.

The first module in each .lcm file is treated as the "main module" of the module (i.e. the library or widget), and other modules are treated as support modules.

Support modules only remain loaded if they are used by the main module, and support modules must be submodules of the main module. For example, if the main module is "com.livecode.newbutton", then all other modules in the bytecode file must have names like "com.livecode.newbutton.<something>".

**Important:** This feature is currently experimental. This means it may not be complete, or may fail in some circumstances that you would expect it to work. Please do not be afraid to try it out as we need feedback to develop it further.

Ensure CMYK JPEGs display correctly on Mac (9.0.0-dp-4)

This fixes the incorrect rendering of CMYK JPEGs containing an ICC profile on Mac.

Calling JavaScript from HTML5 (9.0.0-dp-2)

JavaScript has been added to the `alternateLanguages` on the HTML5 platform.

It is now possible to call JavaScript code from HTML5 standalones by using the `do <script> as <alternateLanguage>` form of the `do` command.

This allows HTML5 standalones to interact with the browser within which they are running. The
The value of the JavaScript expression will be placed in the `result` variable:

```plaintext
local tDocTitle
do "document.title" as "JavaScript"
put the result into tDocTitle
```

**Re-written LCB VM (9.0.0-dp-2)**

The "virtual machine" used to run LiveCode Builder code has been re-written from scratch. This new VM provides a framework enabling better extensibility, better error reporting and, in future, more comprehensive optimizations.

Most existing LCB code should run without any changes. There may be some code that worked on the previous VM but doesn't in the new VM due to more comprehensive run-time checking; this is usually fixable with only very minor changes to the source code.

**Undocumented multi-file libUrlMultipartFormAddPart removed (9.0.0-dp-2)**

Previously, the `libUrlMultipartFormAddPart` command had the undocumented capability to accept multiple file names separated by commas. The handler failed to work for files that had commas in the name, however. The undocumented behaviour has been removed. To add multiple files to a form, call `libURLMultipartFormAddPart` once for each file.

**libURLSetStatusCallback no longer requires a target object for the message (9.0.0-dp-1)**

Passing an object reference as a second parameter to `libURLSetStatusCallback` is no longer required. If no object is passed in then the message will be sent to `revLibURL` itself and you can handle the message anywhere in the message path.

**Platform support end-of-life (9.0.0-dp-1)**

As announced on the LiveCode blog, running LiveCode on the following platforms is no longer officially supported from LiveCode 9.0 onwards:

- Windows XP
- Windows Server 2003
- Windows Vista
- Android Gingerbread (2.3.3-2.3.7)
- Android Ice Cream Sandwich (4.0)
- OS X Snow Leopard (10.6)
- OS X Lion (10.7)
- OS X Mountain Lion (10.8)
- iOS Simulator 6.1
- iOS Simulator 7.1
Field tab alignments in htmlText and styledText (9.0.0-dp-1)

The styledText and htmlText of a field now include tab alignment information. The htmlText uses a new tabalign attribute with a list of alignments, e.g.

```html
<p tabalign='left,center,right'>left\09;middle\09;right\09;</p>
```

The styledText stores tab alignment in a "tabalign" key in each paragraph's "style" array, e.g.

```javascript
get tStyledText[1]["style"]["tabalign"]
```

Specific engine bug fixes (9.0.0-dp-4)

11039  Throw error when changing behavior from behavior script
13055  Improve formatting of try syntax description
13150  Ensure tabStops property docs describe relationship with indent properties
13151  Correct example of setting "listIndent" for whole field
13696  The "volumes" function is only supported on Mac & Windows
13880  Fix formatting in scrollbarWidth property documentation
14172  Clarify that the "combine" command works in lexicographic key order
14247  Clarify insertion point location when field is focused
14363  The "startup" message is sent to the first card of the initial stack
14473  Provide a complete example for revZipAddItemWithData
14801  Correct examples in "split" command documentation
14867  The tabStops property can't be set to a boolean
15117  The "lineOffset" function can search for multiline substrings
15470  Correct "tool" property docs to be clear that it is not a stack property
15604  Update dictionary links to PCRE pattern documentation
16511  Make examples of "borderPixel" use its main synonym
16658  Document the fact that "the environment" may be "server"
18264  Don't fail standalone build completely if unlicensed platforms are selected
18277  Calculate the height of the mac desktop space correctly
18652  Fix occasional crash when getting the clipboarddata["text"] on Windows.
18738  Fix data loss when cr inserted into a styledText run
18852  Fix exception thrown in IDE when saving standalone with more than one stack
18853  Support for loading multi-module bytecode files (experimental)
18923  Ensure CMYK JPEGs display correctly on Mac
18925  Prevent crashes on memory exhaustion
18948  Make 'obj of me' consistent across all control types
Specific engine bug fixes (9.0.0-dp-3)

13370 Correct terminology in "convert" command documentation
14080 Fix find command not finding in specified field when not on current card
18295 Fix empty specialFolderPath("resources") on Windows
18392 Ensure "ceiling" is listed as a reserved word
18686 Fix a crash related to the message watcher
18755 Fix loss of BMP as supported clipboard image format
18762 Fix a rare crash on saving after cloning a field
18873 Fix documentation of valid values for lineSize property
18890 Fix crash when playing non-imported audioclip
18893 Fix formatting in description of stack mode property

Specific engine bug fixes (9.0.0-dp-2)

12196 Correct documentation for "do" command
18147 The scriptExecutionErrors property not listed in dictionary
18231 Fixed documentation formatting issues for binaryEncode and binaryDecode
18350 Fix spurious type errors for repeat variables in LCB
18353 Remove duplicated urlResponse documentation
18495 Undocumented multi-file libUrlMultipartFormAddPart removed
18539 Don't change the defaultFolder on startup
18600 Fix crash when quitting from script editor
18632 Mark the copyResource function as deprecated
18651 Ensure "10 garbage" is never a number
18666 Fix crash when find command matches text in sharedText field on non-current card
18724 Fix incorrect cross-references in lockLocation dictionary entry
18743 Fix missing cross-references in "keys" dictionary entry
18774 Fix errors in "write to file" dictionary entry
18821 Report all LCB stack frames in LCS error info

Specific engine bug fixes (9.0.0-dp-1)

14645 Field tab alignments in htmlText and styledText
14651 There is no documentation entry for "currentcard"
15865 Fixed Dictionary description for "is not among"
16211 Fix compilation errors with MacOSX SDK 10.10 and higher
18111 Make PDF user guide typography match dictionary view
18125 Fix Dictionary example for is within
18254 Improve efficiency of equality operators on binary data
18297 Broken references in "filename of stack" dictionary entry
Show up to 10 nested behavior in the Project Browser (9.0.0-dp-4)

It is now possible to view up to 10 nested behaviors of an object in the PB. The behaviors are shown using oval graphics. Clicking on the graphic takes you to the script of the behavior. The tooltip of the graphic shows the long name of the behavior.

Reinstate store tab of extension manager (9.0.0-dp-4)

The store tab of the extension manager has been reinstated and the revBrowser implementation has been replaced with a browser widget.

SVG icon support in the Extension Builder (9.0.0-dp-4)

The 'Extension Builder' now displays LiveCode Builder extensions' SVG icons, if present. You can add an SVG icon to an LCB extension by setting its "svgicon" metadata to an SVG path that could be displayed by the 'SVG Icon' widget.

When an extension provides an SVG icon, packaging the extension no longer requires you to choose bitmap icon files.

<Shift+Tab> reformats entire script (9.0.0-dp-4)

Holding down the Shift key while pressing the Tab key will reformat the entire script in the Script Editor.

Create script only stack behavior (9.0.0-dp-3)

The menu for assigning a behavior to a control has two additional options:

- Create behavior from new script only stack
- Create behavior using control script and script only stack Either option will prompt you for a stack name and a location for the script only stack. The new stack will be saved, assigned as the behavior of the control, and then added to the stackfiles property of control's stack.

Allow substack to become a mainstack via property inspector (9.0.0-dp-2)
The property inspector Basic pane for substacks now has a button beneath the mainstack labelled "Make mainstack". Note that once pressed this button will disappear, as the stack will no longer a substack.

Drag and drop stackfiles (9.0.0-dp-2)

You can now drag and drop stack files onto the stackFiles field in the PI.

Specific IDE bug fixes (9.0.0-dp-4)

17889 Repaired confusing layout of fill gradient control in Property Inspector
18930 Reinstate store tab of extension manager
18932 SVG icon support in the Extension Builder
18937 <Shift+Tab> reformats entire script
18956 Make sure oauth2 library is loaded correctly
18966 Remove size limitation for creating graphics
18981 Added tooltip to iOS icon and splash screen selection
18987 Reinstate fixedLineHeight for tableField

Specific IDE bug fixes (9.0.0-dp-3)

15917 Font Size for Project Browser can now be set from LiveCode Preferences -> Project Browser
18037 Apply property defaults from metadata when testing widgets
18586 Make sure the Project Browser stack/card/group view can always expand
18897 "Show Sections" for Project Browser can now be set from LiveCode Preferences -> Project Browser
18920 Reinstate that a single char can be selected with the mouse in ScriptEditor

Specific IDE bug fixes (9.0.0-dp-2)

18302 Retain custom prop changes when clicking on tree view in editor
18393 [Project Browser] Change "Sort controls by number" to "Sort controls by layer" to avoid confusion + make sure they are sorted numerically
18491 Allow substack to become a mainstack via property inspector
18595 Clicking left of text now moves caret to the beginning of text
18631 Only use development team preferences when running from the repository
18637 Fix searching in "Stack File and its stack files" from the script editor
18644 Deactivate breakpoints correctly
18701 Prevent over-enthusiastic save prompts
18726 Make sure the Bug Report checkmark appears at the correct place in Standalone Settings
18804 Update locked inspectors when mainstack names change
18835 linkVisitedColor and linkHiliteColor can now be set from property inspector
Setting stackFiles in PI causes an error if you "cancel" the file dialog or select multiple files.

Drag and drop stackfiles

Specific IDE bug fixes (9.0.0-dp-1)

- Fix issue creating breakpoints via the new breakpoint dialog
- Improve user feedback for invalid breakpoint conditions
- Add warning about numerical names to user guide.
- Bring script editor and documentation stacks to front if the stack is already open when navigating to content
- textFont of control does not get set when tabbing out of textFont comboBox in P.I.

LiveCode Builder changes

LiveCode Builder Standard Library

Assertions

- Checks for handler preconditions can now be included using the new `expect` statement. For example, the following statement will throw an error if the value `pProbability` is out of the valid range for probabilities:

```plaintext
expect that (pProbability >= 0 and pProbability <= 1) \ 
  because "Probabilities must be in the range [0,1]"
```

The `that` keyword and the `because <Reason>` clauses are optional.

LiveCode Builder Language

Identifiers

- Unqualified identifiers are now expected to match `[A-Z0-9_]`. The `_` symbol is interpreted as a namespace operator.

Namespaces

- Identifiers in LCB can now be qualified, to disambiguate between symbols defined in different namespaces.

Literals

- Base 2 (binary) integer literals can now be specified by using a "0b" prefix, e.g.
- Base 16 (hexadecimal) integer literals can now be specified by using a "0x" prefix. e.g.

```
0xdeadbeef
0x0123fedc
```

### LiveCode Builder Tools

**lc-compile**

**Errors**

- A new error has been added for identifiers in declaration context that contain `-` - identifiers should always be declared without qualification.

- Parsing of numeric literals, in general, has been tightened up. In particular, the compiler will detect invalid suffixes on numeric literals meaning you cannot accidentally elide a number with an identifier.

```
1.344foo -- ERROR
0xabcdefgh -- ERROR
0b010432 -- ERROR
```

**Messages**

- Errors, warnings and informational messages now display the affected line of code and visually indicate the position where the problem was found. For example, the output might look like:

```
foo.lcb:2:26: error: Identifier 'InvalidExpression' not declared
constant kBadConstant is InvalidExpression
```

**lc-run**

- **lc-run** now has the *experimental* ability to load and run bytecode assemblies containing multiple LCB modules. To construct a multi-module bytecode assembly, simply concatenate several `.lcm` module files together. The first module found in a bytecode assembly is treated as its main module.
LiveCode Builder Documentation

Style guide

- Updated naming guide for handlers and types
- Added indentation and wrapping guidelines
- New section with widget-specific recommendations

Specific LCB bug fixes (9.0.0-dp-4)

18107  Do not permit namespace operator in unqualified identifiers.
18929  Update LiveCode Builder ABI version for LiveCode 9

Specific LCB bug fixes (9.0.0-dp-2)

18856  Use cached numeric values when converting numbers to/from strings

Specific LCB bug fixes (9.0.0-dp-1)

18086  Improve and expand LCB style guide
18385  lc-run: Load multi-module bytecode assemblies.
18463  Show correct error position when source line includes tabs

LiveCode extension changes

Spinner widget

Spinner widget

A new spinner or activity indicator widget has been implemented. Spinners provide visual feedback to users use when performing an activity for an unknown duration such as processing a large amount of data or presenting a complex user interface.

Line Graph widget

Markers

- The new markerScale property controls the size of graph point markers.
- Any named icon from the SVG icon library can now be used as a graph point marker.

Tree View widget
Performance

- Previously when an array was expanded in the Tree View widget, all of the display calculations for were done before the next redraw. Now the keys are sorted (as before) but the display calculations are made for a maximum of 1000 rows. When more rows are needed due to scrolling, another 1000 are calculated at that point.

  This provides a near-continuous scrolling experience for arrays with large numbers of keys, and ties the expense of expanding an array to that of sorting its keys.

Segmented Control widget

Appearance and theming

- Dividers between segments are no longer drawn when the `showBorder` property is `false`.

Properties

- Setting the `itemCount` now updates all other properties immediately, rather than at the next redraw.
- All list-like properties now contain exactly `itemCount` items at all times.
- The `itemNames` property may now include duplicated and/or empty segment names.

JSON Library

JSON parser improvements

- `JsonImport()` no longer incorrectly accepts garbage at the end of a JSON file.
- `JsonImport()` no longer incorrectly accepts unescaped control characters in strings.
- "null" is a valid JSON file, and `JsonImport("null")` no longer throws an error. It returns `nothing` in LCB and the empty string in LiveCode Script.
- A number by itself is a valid JSON file, and `JSONImport("25")` now returns 25, rather than throwing a syntax error.

JSON parser security fixes

- Some crafted JSON files could cause `JsonImport` to use excessive amounts of CPU time. The `JsonImport` function will now reject inputs with more than 500 levels of structure nesting.

oauth2 script library

OAuth2 dialog library

A new library has been implemented for presenting an OAuth2 authorization dialog for any web
service that supports OAuth2 Authorization Code Flow

getopt script library

Command-line option parsing support

The new **getopt** library provides support for parsing Linux-style command-line options.

Specific extension bug fixes (9.0.0-dp-3)

18908  Fix parsing of JSON files containing only a single-digit integer

Specific extension bug fixes (9.0.0-dp-2)

18500  Ensure color properties are documented correctly
18693  Prevent long delays when expanding arrays with many keys
18697  Fix parsing of "lonely number" JSON files
18707  Fix possible denial of service via crafted JSON inputs
18714  Ensure all itemNames, itemLabels etc. can be set to empty
18779  Do not draw borders when showBorder is disabled
